CONTAINED CONTROL

Light is an element that naturally wants to spread and diffuse over every surface it touches, this ability is however both contained and control within the element. Restricting lights diffusion to not only a specific pod, the design also prevents the element from spreading downwards, effectively containing the spread to a controlled environemnt

REVERSE CEILING PLAN
showing the restriction of light within each compoartment, the light is also contained within a bulb that controls its diffusion to only allow top spread.

HUMAN FISH TANK

The re-imagination for the system changes the scale and scope of what is being both controlled and contained. In this sense, divers are trapped within both tank and external apparatus required to survive.
